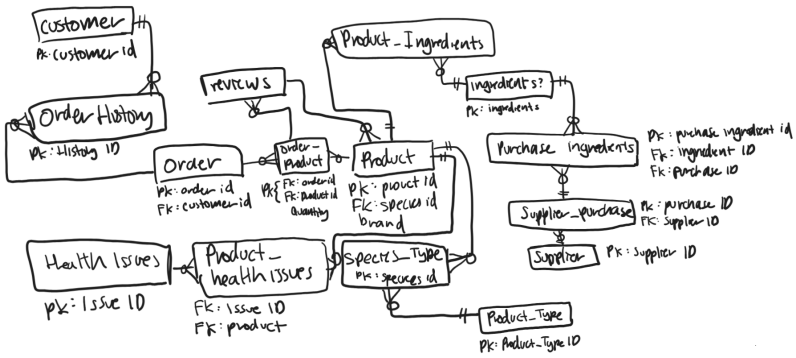
Petco Project

For this project I served as a team lead and worked in collaboration with two other people who I split the work between. As shown in the code above and visual ERD's below this project focused around a petco customer base in which required a mock website. This project required focus and extra attention to detail when thinking about the everyday thinking process of an individual, in this case pet owners. We first had to understand what the customer needs from an account number to medications and other animal accessories. In the ERD the main priority was to get the correct visual flow which is what I specialized in, to correctly flow from one key to the next through the matching ID's. Through this project the importance of starting on a blank canvas emphasized how much detail we had to put into correctly researching what pet owners need and are more likely to purchase.

Rough draft ERD:



Final ERD:
